Customise and use favourites

Customise and use favourites

Context

By default, the left-hand list contains library procedures. It can also bring together procedures useful for the current plan.

Starting point

Step 2 — left-hand list; Import elements

Prerequisites

- Identify the procedures to reuse.

Steps

1. Clear the list if necessary

Open the menu at the top of the left-hand list, then choose Clear to start with an empty selection. You can also keep existing favourites.

2. Open a source plan

Click Import elements, open Available plans and choose the plan containing the procedures to reuse. Expand its structure down to the procedures.

3. Add from the import window

On the required procedure, use the add-to-favourites command. Repeat for other useful procedures; they become available in the left-hand list.

4. Add from your plan

You can also grab a procedure in the current plan and drag it directly to the favourites list, after clearing it or keeping its contents.

5. Reuse a favourite

Find the procedure in the left-hand list, then drag it to the required surface. This lets you reuse a procedure already adapted in the plan on another surface. Then check its parameters.

Expected result

The selected procedures are available in favourites and reused on surfaces.

Remember

- The magnifying glass beside a surface or procedure name searches for that name in the left-hand list. Favourites make entry easier; the library prepares your standard procedures.
